about us

We are an Iranian pioneer company called "Ceramoza" whose main field of activity is designing, producing and supplying luxurious wall tiles, floor ceramics, glazed porcelain tiles and granite products of high quality in different formats. Our team consists of a multidisciplinary group of experts that efficiently combines creativity and experience.

The brand "Ceramoza" has been able to gain a significant share of the market with help of its valued customers and successful experiences in the field of ceramic tile products.

Designers and sales experts of "Ceramoza" with careful studies of the consumer market and technical knowledge of the latest achievements in the design and production of the ceramic tile industry, pay special attention to providing designs and dimensions that meet the needs of the most demanding residential and commercial architecture to satisfy different tastes of the end users.

Our company with its efficient and experienced forces has the ability to produce a variety of products in the tile factories of Apadana Ceram, Alvand, Pars and Hafez Tile.

It is worth noting that Depot warehouses of "Ceramoza" have an exceptional position for consumers in terms of proximity to domestic consumption markets.

BUYING GUIDE

Why Buy Tile?

There are two types of tile – porcelain and ceramic. Both are durable, and inkjet technology is used to create the design of each tile. Inkjet technology is like high definition image capturing. Porcelain and ceramic tiles can be produced to look and feel like real hardwood, natural stone, cement or brick, and they also come in many different textures, colors, and patterns.

What's The Difference Between Porcelain & Ceramic?

Porcelain and ceramic tile are both are made from a mixture of clay and other natural resources, but are used in different ways. Porcelain tile is extremely dense and can be used indoors and outdoors. It's waterproof and can be exposed to cold temperatures. Ceramic tile is also extremely durable, but the main difference is that it's water-resistant and a little more sensitive to varying temperatures. It comes in various colors, textures, and sizes, and can be used in many different ways indoors.

Edges

Choosing the edge of your tile is another factor to consider. Tile comes with two types of edges – rectified and pressed. Rectified edges are cut during production so that every tile is the exact same size, allowing for very thin grout lines. Pressed edges are more rounded, and can have a more dimensional look.

Finishes

The type of finish you choose often comes down to personal preference because both matte and polished tile are great options. Matte tiles are more slip-resistant and have a natural finish that comes in a variety of styles. Polished tiles have a smooth and shiny finish that looks great on both floors and walls. Note that polished tiles are not recommended for floors in wet areas unless they have been pre-treated for slip resistance.

Floor & Wall Tile

It's important to keep in mind that there is tile designed specifically for floors and walls. Floor tile tends to be more durable and is suitable for high traffic areas. It's rated from light residential all the way to heavy-duty commercial applications. Wall tile is designed with decorative appeal in mind and should not be used on floors. Some options can be installed on either service so be sure to take note of the application requirements before selecting your tile.

Durability & Maintenance

Porcelain and ceramic tile are both easy to maintain. As one of the hardest working tiles, porcelain is a great choice for high traffic areas. To maintain your tile, you should clean it regularly with water or a mild detergent. Wall tile should also be cleaned regularly with a damp cloth or sponge. Grout is key when it comes to tile, so be sure to seal your grout after installation.

Easy to maintain, durable, and stylish, tile is a great choice for your home.

INSTALLATION

A clean, precise tile installation is easier than you might think. With planning, preparation, and our step-by-step advice, you can do it on your own.

Step 1: Prepare the Surface
Make sure your surfaces are clean, smooth, and dry for best results. Take time to repair, patch, and level any damaged or uneven areas. Double check to make sure the surface is structurally sound and the area free of wax, soap scum, and grease.Remove any moldings, trim, or appliances that may interfere with tile application and check the doorjambs to make sure tile has clearance when installed beneath. Identifying those potential complications in advance will help your installation run smoothly.

Step 2: Begin Your Layout
For an efficient layout, start by marking the center point of each of the walls in the room. Next, snap chalk lines between the center points of opposite walls to pinpoint the center of the room. Make any necessary adjustments to ensure that the intersection creates perfect squares. Starting at the center point, lay a row of loose tiles along the center lines in both directions, using tile spacers as you go for even, uniform joints. Once you reach the walls, you'll need to cut tiles for a proper fit. If the cuts needed are smaller than half of a tile, you can adjust the center line by snapping a new line a half-tile size closer to the wall. If necessary, repeat this step along the intersecting center line for a precise design. To make a large room more manageable, divide each section into smaller 2' x 3' grids by snapping additional lines parallel to the centerlines.

Step 3: Apply the Adhesive
As a general rule of thumb, be mindful to mix only enough of the adhesive to be used within 30 minutes. Using the flat side of the trowel type recommended on the adhesive package, spread a 4/1" coat on the surface of one grid area without covering the guidelines.
After doing so, hold the trowel at a -45 degree angle and use the notched side to comb adhesive into standing ridges. When you remove the excess adhesive, you leave behind a uniform, ridged setting bed for your tile. As another rule of thumb, do not spread a larger area of your adhesive than can be set in 15 minutes. Stick to the script and facilitate your tile installation with the perfect adhesive application.

Step 4: Cut Tile as Needed
Start by marking carefully measured cuts-to-be with a pencil or felt-tip pen on the tile surface. You can use a tile cutter to achieve pinpoint straight or diagonal cuts. Make masterful curved cuts with a nipper, chipping away small pieces for best results.
For any full-length curved cuts, a rod saw is most properly suited to handle the task. After your cuts are made, smooth out any sharp edges with a carborundum stone to give a soft finish to your tile.

Step 5: Set Your Tile
Now that you've primed the surface, created the layout, applied the adhesive, and cut the tile, you are fully prepared for the actual installation of your tile. Begin by installing tiles in the center of the room, one grid at a time, finishing each grid before moving on to the next. Within each grid, it will help to start the first tile in the corner and work outward.Using a slight twisting motion, set tiles one at a time and avoid sliding them into place. Be sure to either insert spacers as each tile is set or leave equal joints between tiles. Save the perimeter tiles in each grid for last, leaving a 4/1th inch gap between the tile and wall.
Once a grid is completely installed, tap in all tiles with a rubber mallet or hammer and wood block to ensure a solid bond and level plane. Remove excess adhesive from joints with a putty knife and from tile with a damp sponge to prevent an uneven appearance.
Lastly, allow your hard work at least 24 hours to set before walking on it. And of course, take at least 20 minutes to admire the time and care you have put in to your new floor!

Step 6: Grouting Joints
Now that your ceramic tile is in place and has had 24 hours to set, your last Step is to "grout" or fill the joints and consolidate your floor into one mass. After carefully reading and following all instructions and precautions on the grout package, make only enough to use in a -30 -minute period. As you remove the tile spacers and spread grout on the tile surface, use a rubber grout float or a squeegee to force it down into the joints.
Tilt the float at a -45 -degree angle and with the edge of the float, remove the excess grout from the surface immediately. Now tilt the float at a -90 -degree angle and scrape it diagonally across the tiles.
Once you've let the grout set slightly for around 15 to 20 minutes, use a damp sponge to clean any residue from the surface and smooth the grout joints.make sure to rinse your sponge frequently and change the water when needed.
Polish with a soft cloth when the grout has dried and haze forms on the tile surface, and rinse again with sponge and clean water if necessary.
Give your newly grouted floor 72 hours before any heavy use and at least three weeks before applying sealers or polishes.
Take a deep breath and let out a sigh of relief; you have just completed your floor with your ceramic tile.

CLEANING

Basic Maintenance

Sweep or vacuum floors to remove any dust or debris before using any cleaning products. Damp-mop your tile floor at least once each week (more frequently for heavy traffic areas) to decrease wear and abrasion from grit and soil.

Glazed Tile

Clean regularly with an all-purpose, non-oil-based household cleaner that's compatible with cleaning grout joints. Use an everyday multipurpose spray cleaner to remove soap scum, hard water deposits, and mildew on wall tiles in your bath or shower.

Unglazed Tile

Use concentrated tile cleaners that have a neutral pH for regular cleaning. These will safely remove grease, oils, and normal spills—just check to be sure the cleaner is intended for the application, use, and traffic level. Clean glass tile with any nonabrasive cleaner recommended for either glass or tile.

Tips for Preventing Damage

Test scouring powders and sealants on a small area before cleaning the full area.
Use a sealer on grout joints shortly after installation and use products compatible with cleaning grout joints.
After cleaning, rinse the entire area with clear water to remove any cleaning solution residue.
Have any damaged or broken tile removed and replaced only by a qualified tile contractor.

What to Avoid

Any cleaners containing acid or bleach shouldn't be used for routine maintenance.
Avoid wax-based cleaners and oil-based detergents, and use sealants on grout joints only.
Harsh cleaning aids like steel wool pads or any scouring pads containing metal shouldn't be used on tile.
Unglazed tile should not be cleaned with an agent that contains color.

How to Clean Wall Tiles

With the grout back to brand spanking new, give your tiles some love. Consider the finish of your wall tiles before you start. For example, for plain ceramic tiles, a scouring pad should be ok. However, for printed pattern tiles, it might be safer to use a soft sponge or microfiber cloth. Never use vinegar or harsh cloths on marble!
If you can, run some hot water over or near the tiles to open up the ceramic pores and really get deep into the dirt.
Choose the right cleaner for your wall tiles, depending on their material. A gentle stonewash cleaner is suitable for travertine, limestone, granite, sandstone, slate, marble and polished porcelain.
For heavy duty grime, you might need something a little stronger to remove stains like oil, grease and any ingrained dirt.

How to Clean Grout

We all know how quickly dirty grout that's supposed to be white can transform the look of a room. So cleaning your grout is the best place to start - and a quick win to give you some big cleaning satisfaction.
The best way to tackle grout and remove built-up grime is to use an old toothbrush as your weapon of choice.
For mild stains, a nifty trick is to mix some baking soda with vinegar to form a paste. Get involved and get scrubbing with a dollop of elbow grease, using your toothbrush to work the paste in between the tiles. Leave it for 30 minutes before you rinse off.
For dirtier, stubborner stains, use a grout stain remover or grout cleaner that's safe for your tiles. Make sure you test the cleaner in an area not visible first.

How to Clean Tile Floors

As there's often a larger surface to cover with floor tiles, sometimes it's easier to just break out the steam cleaner! Although an appealing option, it's not always suitable for certain tiles so check first to avoid any risk of scratching your tiles.
For longevity of your floors, use the correct maintenance cleaner to increase the life of the protective seal. Meaning these deep cleans don't become a regular chore!
Be careful using normal detergents, we'd even say avoid it. On sealed surfaces, normal cleaning products and strong bleach will remove the protective seal.
